1 Measure Theoretic Prerequisites

Definition 1. For a sample space Ω we say that a collection of subsets \mathcal{F} is a σ -algebra if \mathcal{F} satisfies three conditions:

1. $\Omega \in \mathcal{F}$
2. If $A \in \mathcal{F}$ then $\bar{A} \in \mathcal{F}$
3. For any countable set of subsets in \mathcal{F} , the union of these subsets is in \mathcal{F} . Symbolically, if $(A_n)_{n \geq 1} \in \mathcal{F}$ then $\bigcup_{n=1}^{\infty} A_n \in \mathcal{F}$

A set $A \in \mathcal{F}$ is called a measurable set¹.

Lemma 1. If $A_1, A_2, \dots, A_N \in \mathcal{F}$ then $\bigcup_{n=1}^{\infty} A_n \in \mathcal{F}$.

Proof. From Definition ?? Conditions ?? & ?? we have $\bar{\Omega} \in \mathcal{F}$. But Ω is our sample space, so, $\bar{\Omega} = \emptyset \in \mathcal{F}$. By Condition ?? we have $\bigcup_{n=1}^{\infty} A_n \in \mathcal{F}$. Construct $(A_n)_{n \geq 1}$ where for $n \geq N + 1, A_n = \emptyset$. So,

$$\begin{aligned} \bigcup_{n=1}^{\infty} A_n &\in \mathcal{F} && \text{but,} \\ \bigcup_{n=1}^{\infty} A_n &= \bigcup_{n=1}^N A_n \cup \emptyset \cup \emptyset \cup \emptyset \cup \dots = \bigcup_{n=1}^N A_n \\ \Rightarrow \bigcup_{n=1}^N A_n &\in \mathcal{F} \end{aligned}$$

□

Lemma 2. If $(A_n)_{n \geq 1} \in \mathcal{F}$ then $\bigcap_{n=1}^{\infty} A_n \in \mathcal{F}$.

¹This is something worthy of definition itself but is omitted in this course.

Proof. By De Morgan's laws we have,

$$\begin{aligned}
\overline{A_1 \cup A_2 \cup \dots} &= \overline{A_1} \cap \overline{A_2} \cap \dots \iff (\cap_{n=1}^{\infty} A_n) = \overline{(\cup_{n=1}^{\infty} \overline{A_n})} \quad \text{but,} \\
&\quad \cup_{n=1}^{\infty} \overline{A_n} \in \mathcal{F} \quad \text{From Definition ?? Condition ?? and} \\
&\quad \overline{(\cup_{n=1}^{\infty} \overline{A_n})} \in \mathcal{F} \quad \text{From Condition ??} \\
\implies \overline{(\cup_{n=1}^{\infty} \overline{A_n})} &= (\cap_{n=1}^{\infty} A_n) \in \mathcal{F}
\end{aligned}$$

□

Lemma 3. If $(A_n)_{n \geq 1} \in \mathcal{F}$ then $\cap_{n=1}^N A_n \in \mathcal{F}$. That is, Lemma 2 holds for finite intersections.

Proof. From Definition ?? Condition ?? we have $\Omega \in \mathcal{F}$. From Lemma ?? we have $\cap_{n=1}^{\infty} \Omega \in \mathcal{F}$. Construct $(A_n)_{n \geq 1}$ where for $n \geq N + 1$, $A_n = \Omega$. So,

$$\begin{aligned}
&\cap_{n=1}^{\infty} A_n \in \mathcal{F} \quad \text{but,} \\
&\cap_{n=1}^{\infty} A_n = \cap_{n=1}^N A_n \cap \Omega \cap \Omega \cap \Omega \cap \dots = \cap_{n=1}^N A_n \\
\implies \cap_{n=1}^N A_n &\in \mathcal{F}
\end{aligned}$$

□

Examples: Consider two extreme cases,

1. $\mathcal{F} = \{\emptyset, \Omega\}$
2. $\mathcal{F} = \mathcal{P}(\Omega) = 2^{\Omega}$

Both satisfy Definition ?? Condition ?? by construction. The first satisfies Condition ?? since $\overline{\emptyset} = \Omega \in \mathcal{F}$ and $\overline{\Omega} = \emptyset \in \mathcal{F}$. The first also satisfies Condition ?? since a countable union of \emptyset and/or Ω will be either \emptyset (in the case of unions of strictly \emptyset) or Ω (all other cases). Thus, the first example is a σ -algebra. The second satisfies Condition ?? since if $A \in \mathcal{F}$ then $\overline{A} \in \mathcal{P}(\Omega)$ and $\overline{\overline{A}} = (\mathcal{P}(\Omega) \setminus \{A\}) \in \mathcal{P}(\Omega)$ (by definition of the power set). Finally, the second example satisfies Condition ?? since, by construction, unions of elements in the power set is already an element in the power set. Thus, the second example is a σ -algebra.

Definition 2. If \mathcal{C} is any collection of subsets of a sample space Ω (not necessarily a σ -algebra), we let $\sigma(\mathcal{C})$ denote the smallest σ -algebra containing \mathcal{C} . That is, $\sigma(\mathcal{C})$ must contain Ω and become closed under intersection and union (with respect to Ω). We say \mathcal{C} generates $\sigma(\mathcal{C})$.

Example

Let $A \subsetneq \Omega$ and $\mathcal{C} = \{A\}$ then it is clear that $\{A, \overline{A}\}$ is not closed under unions, but

$$\sigma(\mathcal{C}) = \{A, \overline{A}, \emptyset, \Omega\}$$

Definition 3. If $\mathcal{C} = \{A \subseteq \mathbb{R}^n : A \text{ is open}\}^2$ in \mathbb{R}^n then $\sigma(\mathcal{C})$ is called the family of Borel sets on \mathbb{R}^n . We write in this case $\sigma(\mathcal{C}) = \mathcal{B}(\mathbb{R}^n)$.

Proposition 1. $\mathcal{B}(\mathbb{R}) = \sigma(\{(-\infty, x] : x \in \mathbb{R}\})$

To do: Think about this.

1.1 Probability Measures

Definition 4. A function $\mathbb{P} : \mathcal{F} \rightarrow \mathbb{R}$ is called a probability measure if

1. $\mathbb{P}(\Omega) = 1$
2. $0 \leq \mathbb{P}(A) \leq 1$
3. If A_1, A_2, \dots are disjoint in \mathcal{F} then $\mathbb{P}(\bigcup_{n=1}^{\infty} A_n) = \sum_{n=1}^{\infty} \mathbb{P}(A_n)$

Some consequences of Definition ?? (stated without proof... to do: state with proof):

1. $\mathbb{P}(\bar{A}) = 1 - \mathbb{P}(A), A \in \mathcal{F}$
2. $\mathbb{P}(\emptyset) = 0$
3. $\mathbb{P}(A \cup B) = \mathbb{P}(A) + \mathbb{P}(B) - \mathbb{P}(A \cap B)$
4. If $A \subseteq B$ then $\mathbb{P}(A) \leq \mathbb{P}(B)$
5. $\mathbb{P}(\bigcup_{n=1}^{\infty} A_n) \leq \sum_{n=1}^{\infty} \mathbb{P}(A_n)$ (for not necessarily disjoint A_n)
6. etc... (there's more but we didn't elaborate – these are usual results you would expect from a basic probability course)

Definition 5. A function $F : \mathbb{R} \rightarrow \mathbb{R}$ is a distribution function if

1. $\forall x, y \in \mathbb{R}, x \leq y \implies F(x) \leq F(y)$
2. $\lim_{x \rightarrow -\infty} F(x) = 0, \lim_{x \rightarrow \infty} F(x) = 1$
3. F is right continuous, that is, $\forall a \in \mathbb{R}^+, \lim_{x \rightarrow a^+} F(x) = F(a)$

Proposition 2. If \mathbb{P} is a probability measure on $(\mathbb{R}, \mathcal{B}(\mathbb{R}))^3$ then $F(x) = \mathbb{P}((-\infty, x])$ is a distribution function.

To do: Figure out proof ... “This is easy to prove, but hard to prove the converse”.

²Worthy of definition.

³To be a probability measure \mathbb{P} on $(\mathbb{R}, \mathcal{B}(\mathbb{R}))$ means to be a function $\mathbb{P} : \mathcal{B}(\mathbb{R}) \rightarrow \mathbb{R}$.

2 Integration

Definition 6. A function $s : \Omega \rightarrow \mathbb{R}$ is simple if we can write

$$s = \sum_{n=1}^N a_n \mathbb{1}_{A_n}$$

where $a_n \geq 0$ and A_1, A_2, \dots, A_N are disjoint sets in our σ -algebra \mathcal{F} .

Definition 7. Let s be a simple function. Then the expectation (the integral) of s is

$$\mathbb{E}[s] = \int s d\mathbb{P} = \int_{\Omega} s(\omega) \mathbb{P}(d\omega) = \sum_{n=1}^N a_n \mathbb{P}(A_n)$$

Proposition 3. If $(s_n)_{n \geq 1}$ is a sequence of increasing simple functions bound by some function s ,

$$s_n \leq s_{n+1} \leq s$$

and $s_n(\omega) \rightarrow s(\omega)$ as $n \rightarrow \infty, \forall \omega \in \Omega$ then,

$$\int s_n d\mathbb{P} \rightarrow \int s d\mathbb{P}$$

Definition 8. A function $X : \Omega \rightarrow \mathbb{R}$ is called a random variable, or \mathcal{F} -measurable, if $\{\omega \in \Omega : X(\omega) < \lambda\} \in \mathcal{F}$ for all $\lambda \in \mathbb{R}$. We write $X \in \mathcal{F}$ (i.e. X is \mathcal{F} -measurable).

From Definition ?? we can prove a bunch of facts like the sum of two random variables is a random variable, etc... Some consequences of our definitions:

1. ...
2. ...
3. If you have a sequence of random variables $X_n \in \mathcal{F}, n \in \mathbb{N}$ then the $\inf X_n \in \mathcal{F}$ and the $\sup X_n \in \mathcal{F}$ (i.e. these are random variables).

We're doing this so that we can show that it's possible to approximate any random variable with simple functions or a sequence of simple functions.

Proposition 4. If $X \geq 0$ is a random variable then there exists (a sequence?) s_n such that s_n is increasing and converges to X , denoted $s_n \uparrow X$.

Proposition 5. If $X \in \mathcal{F}$ and $X \geq 0$ and $(s_n), (s_m)$ are simple, with $s_n \uparrow X$ and $s_m \uparrow X$, then

$$\lim_n \int s_n d\mathbb{P} = \lim_m \int s_m d\mathbb{P}$$

Definition 9. If $X \in \mathcal{F}$ and $X \geq 0$ then

$$\mathbb{E}[X] = \lim \int s_n d\mathbb{P}$$

when $s_n \uparrow X$. For a general $X \in \mathcal{F}$ write

$$X = X^+ - X^-$$

and define

$$\mathbb{E}[X] = \mathbb{E}[X^+] - \mathbb{E}[X^-] \quad (\text{although you can't have } \infty - \infty, \text{ etc...})$$

This has all the basic properties of expectation

1. $\mathbb{E}[\alpha X_1 + \beta X_2] = \alpha \mathbb{E}[X_1] + \beta \mathbb{E}[X_2]$
2. \dots
3. Monotone convergences: If $X_n \uparrow X$ then $\mathbb{E}[X_n] \rightarrow \mathbb{E}[X]$
4. If $X_n \geq 0$ then $\mathbb{E}[\liminf_n X_n] \leq \liminf_n \mathbb{E}[X_n]$ (Fatou's Lemma)

2.1 Integrability

Definition 10. A nonnegative $X \in \mathcal{F}$ is integrable if $\mathbb{E}[X] < \infty$. To show this we write $X \in L^1(\mathcal{F})$.

Proposition 6.

1. $X, Y \in L^1 \implies X + Y \in L^1$
 $\lambda X \in L^1, \forall \lambda \in \mathbb{R}$
 $\mathbb{E}[\lambda X] = \lambda \mathbb{E}[X]$
2. $X \in L^1 \iff |X| \in L^1$
 $|\mathbb{E}[X]| \leq \mathbb{E}[|X|]$
3. $|X| \leq Y \in L^1 \iff |X| \in L^1$

Theorem: (Lebesgue) Dominated Convergence Theorem.

Let $(X_n)_{n \in \mathbb{N}} \in \mathcal{F}$. If $\exists Y \in L^1(\Omega, \mathcal{F}, \mathbb{P})$ such that $|X_n| \leq Y$ for all n , if

$$\begin{aligned} X_n(\omega) &\longrightarrow X(\omega) \quad \text{a.s.}^4 \quad \text{then,} \\ \mathbb{E}[X_n] &\longrightarrow \mathbb{E}[X] \quad \text{a.s} \end{aligned}$$

Proof omitted.

Lemma 4. Suppose $Z \in \mathcal{F}$ and $\mathbb{E}[\mathbf{1}_A Z] = \int_A Z d\mathbb{P} \leq 0$ for all $A \in \mathcal{F}$. Then $Z \leq 0$ a.s.⁵

⁴A property holds “almost surely” (a.s.) if it holds everywhere except on a set of measure 0.

⁵ $\mathbb{P}(\{\omega \in \Omega : Z(\omega) > 0\}) = 0$

Theorem: (Another) Dominated Convergence Theorem.

If $X, Y, (X_n)_{n \geq 1} \in \mathcal{F}$ with $Y \in L^1$ and

$$\begin{array}{ll} |X_n| \leq Y & \forall n, \text{ a.s. and} \\ X_n \longrightarrow X & \text{a.s. then,} \\ X_n \in L^1 & \text{and} \\ \mathbb{E}[X_n] \longrightarrow \mathbb{E}[X] & \text{a.s} \end{array}$$

Proof omitted.

Definition 11. For $1 \leq p < \infty$ let \underline{L}^p consist of all random variables $X \in \mathcal{F}$ such that

$$\mathbb{E}[|X|^p] < \infty$$

We can prove that, for $X, Y \in \underline{L}^p$,

$$\mathbb{E}[|X + Y|^p] \leq 2^{p-1}(E[|X|^p] + E[|Y|^p]) < \infty$$

So \underline{L}^p is a linear space⁶

⁶From some theorem we have, for $a, b \geq 0$ and $1 \leq p < \infty$, $(a + b)^p \leq 2^{p-1}(a^p + b^p)$
